

Ascom TelliConnect Station — automate clinical workflows from the bedside for more complete patient centric care

Promote patient-centric care by automating clinical workflows, integrating with surrounding systems and empowering staff to focus more on the patient and less on administrative activities.

Today's nurse managers are asking for solutions to reduce documentation and increase the time that caregivers spend with the patient. The Ascom TelliConnect Station provides the smart bed needed to support behind the scenes automated workflows and orchestration activities.

Ascom TelliConnect Station benefits:

- Centralized task management to automate requests (such as rounding and patient assessments) and takes the burden of managing tasks off staff members by providing a silent queue when the task is needed
- Automated logging of task completion, giving visibility into tasks which are taking the most time

- HL7 output means critical information can be shared with other systems, helping to reduce manual and double documentation
- More information in the hands of care teams helps them respond more quickly and can reduce the number of workflow steps compared to traditional nurse call systems

Ascom Telligence® utilizes the TelliConnect Station as a technology hub at the point of care for integrating medical equipment and the surrounding systems. This provides a more complete picture of the patient situation. Alternatively, the Ascom TelliConnect Station can operate independent of the Ascom Telligence system.

Ascom TelliConnect Station

The wall-mounted TelliConnect Station enhances staff-to-staff and staff-to-patient communications. It supports automated workflows from the patient bedside, and aids in requesting services and providing information on room status. Workflow buttons can be customized for each care setting or application:

- Nurse Round Timers allow staff to select a configurable button to set rounding timers or manually enter a recurring rounding clock time
- Timers may include reminders to check skin, bathroom needs, nutrition, blood sugar, fluids or other custom events
- Bed Management facilitates patient discharge activities, such as environmental services for turning over rooms, transport for moving the patients, and food services to stop deliveries and reduce waste. Turning rooms more efficiently positively impacts revenue and reduces patient and family frustration
- Patient Flow can be accelerated by creating workflows for PT, RT, transport, radiology, pharmacy, etc., to reduce wait times and improve productivity
- Audio Communications allow calls to be placed to the front desk, the pharmacy to check on prescriptions, or to the lab to check on results, saving caregivers time by not traveling to get the information
