

[ PRODUCT SHEET: ]

<b>Product:</b>	teleCARE IP Ward Controller
	Cost-effective solution for migrating to teleCARE IP
	Compatible with teleCARE SC and teleCARE M
	10/100 Base-T Ethernet connectivity
	Optional voice module for speech capability
	Short circuit protected outputs
	Reverse polarity input power protection

## ASCOM teleCARE IP WARD CONTROLLER BREATHE NEW LIFE INTO YOUR EXISTING teleCARE SYSTEMS

Upgrading existing teleCARE SC and teleCARE M networks with state-of-the-art IP functionality is carried out easily and cost-effectively using the ASCOM teleCARE IP Ward Controller.

The Ascom teleCARE IP Ward Controller is a centralized migration solution for teleCARE IP functionality, without entirely upgrading existing teleCARE SC, teleCARE M and/or competitor systems.\*

### Single-step migration

Installation and set-up of the Ascom teleCARE IP Ward Controller is performed by substituting the teleCARE M intelligent address module (IAM).

Once installed, the Ward Controller provides seamless and transparent integration of teleCARE M and teleCARE SC systems, and associated peripherals, into a platform completely compatible with teleCARE IP.

The teleCARE Ward Controller is similar in size to teleCARE M IAM, so no additional space is required for installation. When a teleCARE SC cabinet is replaced, significant space is recaptured.

### Extended functionality

In addition to ten (10) detachable address connectors that support 10 existing teleCARE M room buses (addresses), the Ward Controller can be equipped with an optional voice module for speech support.

The Ascom teleCARE Ward Controller features a high-speed processor, supported by 16MB of flash memory and 64MB of internal RAM; IP connectivity is provided by a 10/100 Base-T Ethernet connection; and it is protected against wrong polarity and room bus short-circuiting.

\* An assessment must be performed to verify the compatibility of a competitor system with the Ascom teleCARE IP Ward Controller.
