

# Wide-Area Duress Solution to support healthcare professionals

*Ascom Myco along with GAP Guardian application is a Wide-Area Duress solution that provides an effective way to raise an alert in a dangerous situation or personal threat to lone workers in the community...*

## **Help is just a push button away**

Ascom Myco has a dedicated alarm button and offers personal safety features suitable for lone workers deployed in environments exposed to security and other operating risks. A simple push-button discretely activates a wide-area SOS alarm, helping to ensure the safety of staff working in potentially hazardous situations.

## **Man-down/No-movement alarm**

Automated alarms help improve safety for lone workers. 'Man-down' is triggered if the handset doesn't move beyond a set threshold for a set period. The solution discretely warns the user prior to activating a distress call to prevent false alarms.

## **Global Positioning System (GPS)**

The GPS function adds system awareness of where users/handsets are located to quickly locate staff in cases of emergency.

### Welfare & Status tools

At the click of a button, a user can perform a safety check. The check-in scheduler lets you easily define and assign check-in schedules and automates missed or overdue check-ins. Schedules can be configured at recurring intervals or at certain times of the day (with full support for varying time zones).

### Monitor Me

A feature for peace-of-mind in high-risk situations, it allows the user to set a manual check-in schedule, switch on GPS tracking, and monitor device movement.

### Reliable & versatile communication

Dependent on the type of alarm raised, the device and platform can respond by initiating several different communication types such as voice, SMS, and email – all including relevant geolocation information. Alerts are managed and distributed centrally whether it's an SOS, crossed geofence, overdue check-in or man-down alert.

### Emergency Operations Centre

Wide-area alerts from Ascom Myco handsets are sent to our 24/7/365 international emergency response coordination centre, or optionally any other alarm receiving centre or internal system.

### Reporting tool

It is possible to maintain comprehensive, time-stamped logs that include all messages, GPS coordinates and, notes added by incident managers. This is a useful tool for journey monitoring, incident investigations, training or continuous improvements to practices.
